

# MISO/PJM Economic Upgrade Examples

1. Review survey questions
2. More examples
  - Show allocations at the zonal level as well as at the RTO level
  - Show examples with benefit to both
  - Show allocations using joint market versus separate markets (hurdle)
  - Demonstrate a complete example of any and all thresholds we are currently proposing – ie Top to bottom example including allocations
3. More comparisons of the DFAX screen method – how well it correlates with projects showing benefits to both in econ analysis – check anomalous prior results
4. SPP Portfolio approach – presentation
5. Exelon Congestion Charge Analysis - presentation

# Economic Upgrade Examples

- ▶ Examples illustrate the economic impact on MISO, PJM and total system of relieving an economic constraint
- ▶ Several constraints selected from a MISO/PJM annual PROMOD base case simulation
- ▶ Each constraint was relieved one at a time and results compared back to base case simulation
- ▶ Constraint relieved by increasing the facility rating to 9999 simulating an upgrade designed to eliminate constraint
- ▶ Purpose of examples is to use actual system simulations to assist group in development of:
  - Cross-border economic constraint threshold/indicator
  - Cross-border economic benefit metric
  - Cross-border economic upgrade cost allocation method

# Evaluated Constraints

<b>Monitor Facility</b>	<b>Contingency Facility</b>	<b>Base Case Hours Binding</b>	<b>Estimated Congestion (\$Millions)</b>
Black Oak - Bedington 500 kV	Pruntytown - Mt. Storm 500 kV	1842	440
Palisades - Roosevelt 345 kV	No Outage	1038	16
Saukville - Pleasant Valley 138 kV	Saukville - Barton 138 kV	1377	52
Bedford - Seymour 138 kV	Bedford - Columbus 345 kV	221	58
Paddock 345/138 Transformer	Wempletown-Rockdale 345	3360	88
Cayuga-Eugene 345 kV	Cayuga-Nucor 345	164	4

# Evaluated Constraints

- ▶ Adjusted production cost (APC) is equivalent to total load benefit plus total generation benefit:

$APC = \text{Net Load Payment (NLP)} - \text{Net Gen Revenue (NGR)}$

where  $NLP = \text{gross load payment minus FTR credits}$  and

$NGR = \text{gross gen revenue minus gen production cost}$

- ▶ Since  $APC = NLP - NGR$ , the proposed blended metrics that multiply APC by .7 discount generator benefits by 30% and give higher weighting to load impact
- ▶ Proposed blended metrics:
  - $70\%APC + 30\%GLP = .7(NLP) - .7(NGR) + .3(GLP)$   
 $= GLP - .7(\text{FTR Credits}) - .7(NGR)$
  - $70\%APC + 30\%NLP = .7(NLP) - .7(NGR) + .3(NLP)$   
 $= NLP - .7(NGR)$   
 $= GLP - \text{FTR Credits} - .7(NGR)$

# Observations on Metrics (cont.)

- ▶ All study upgrades yield lower total system adjusted production costs and lower total system congestion costs
- ▶ For those upgrades deriving benefit from increased generator revenues, the blended metrics show a smaller amount of benefit or a non-benefit when compared to APC benefit due to higher weight placed on load benefits
- ▶ For those upgrades deriving benefit from decreased load payments, the blended metrics show a larger amount of benefit when compared to APC benefit due to higher weight placed on load benefits
- ▶ 70%APC + 30%NLP metric will always yield a lower benefit value than the 70%APC + 30%GLP metric due to full FTR credit

# Observations on Metrics (cont.)

Do study upgrades provide total system benefit for various listed metrics ?

Metric	Backlog Reduction	Passes Road	Skills Retention	Rebid Sync	Productive Time	Group Effort
Cost Benefit	No	Yes	Yes	No	Yes	Yes
Loss Benefit	Yes	No	No	Yes	No	No
Adjusted Productive Cost Benefit (APC)	Yes	Yes	Yes	Yes	Yes	Yes
70%APC+30%CE Benefit	Yes	Yes	Yes	Yes	Yes	No
70%APC+30%NL Benefit	Yes	No	No	Yes	No	No

# Metrics as Allocators

Metric	Bakks/Belton	Pisot/Rosed	Sukle/Pearl Valley	Edin/Snow	Padak/Tarone	Cay/Egre
Load Benefit	PM	MBO	MBO	BOH	MBO	MBO
Adjusted Return Cost Benefit (APC)	PM	BOH	BOH	MBO	BOH	BOH
70%(APC)+30%(LF) Benefit	PM	MBO	MBO	BOH	MBO	MBO
70%(APC)+30%(NP) Benefit	PM	MBO	MBO	PM	MBO	MBO

- ▶ Table shows beneficiary of each upgrade based on various metrics
- ▶ APC metric shows more benefits to both RTOs while blended metrics show only one RTO as beneficiary
- ▶ Blended metrics place higher weight on load impact and only one RTO typically shows load payment decrease due to locational nature of transmission constraints therefore blended metrics show the RTO with load payment decrease as the beneficiary
